Abstract

abstract to be written

1 Introduction

We follow the necessary definitions in [?].

Definition 1. For a Cauchy surface Σ , we define \mathcal{H}_Σ to be the Hilbert space of \mathcal{C}^4 valued, square integrable functions on Σ . Furthermore, let $\text{Pol}(\mathcal{H}_\Sigma)$ denote the set of all closed, linear subspaces $V \subset \mathcal{H}_\Sigma$ such that both V and V^\perp are infinite dimensional. Any $V \in \text{Pol}(\mathcal{H}_\Sigma)$ is called a polarisation of \mathcal{H} . For $V \in \text{Pol}$, let $P_\Sigma^V : \mathcal{H}_\Sigma \rightarrow V$ denote the orthogonal projection of \mathcal{H}_Σ onto V .

The Fock space corresponding to polarisation V on Cauchy surface Σ is then defined by

$$\mathcal{F}(V, \mathcal{H}_\Sigma) := \bigoplus_{c \in \mathbb{Z}} \mathcal{F}_c(V, \mathcal{H}_\Sigma), \quad \mathcal{F}_c(V, \mathcal{H}_\Sigma) := \bigoplus_{\substack{n, m \in \mathbb{N}_0 \\ c = m - n}} (V^\perp)^{\wedge n} \otimes \bar{V}^{\wedge m}, \quad (1)$$

where \bigoplus denotes the Hilbert space direct sum, \wedge the antisymmetric tensor product of Hilbert spaces, and \bar{V} the conjugate complex vector space of V , which coincides with V as a set and has the same vector space operations as V with the exception of the scalar multiplication, which is replaced by $(z, \psi) \mapsto z^* \psi$ for $z \in \mathbb{C}, \psi \in V$.

Each polarisation V splits the Hilbert space \mathcal{H}_Σ into a direct sum, i.e., $\mathcal{H}_\Sigma = V^\perp \oplus V$. The "standard" polarisation \mathcal{H}_Σ^+ and \mathcal{H}_Σ^- are determined by the orthogonal projectors P_Σ^+ and P_Σ^- onto the free positive and negative energy Dirac solutions, respectively, restricted to Σ :

$$\mathcal{H}_\Sigma^+ := P_\Sigma^+ \mathcal{H} = (1 - P_\Sigma^-) \mathcal{H}_\Sigma, \quad \mathcal{H}_\Sigma^- := P_\Sigma^- \mathcal{H}_\Sigma. \quad (2)$$

Given two Cauchy surfaces Σ, Σ' and two polarisations $V \in \text{Pol}(\mathcal{H}_\Sigma)$ and $W \in \text{Pol}(\mathcal{H}_{\Sigma'})$ a sensible lift of the one particle Dirac evolution $U_{\Sigma', \Sigma}^A : \mathcal{H} \rightarrow \mathcal{H}_\Sigma$ should be given by a unitary operator $\tilde{U}_{\Sigma', \Sigma}^A : \mathcal{F}(V, \mathcal{H}_\Sigma) \rightarrow \mathcal{F}(W, \mathcal{H}_{\Sigma'})$ that fulfils

$$S_A \psi_{V, \Sigma}(f) (\tilde{U}_{\Sigma', \Sigma}^A)^{-1} = \psi_{W, \Sigma'}(U_{\Sigma', \Sigma}^A f), \quad \forall f \in \mathcal{H}_\Sigma. \quad (3)$$

Don't cite so much of ivp0, just the bare essential stuff for what is needed here.

Here, $\psi_{V,\Sigma}$ denotes the Dirac field operator corresponding to Fock space $\mathcal{F}(V, \Sigma)$, i.e.,

$$\psi_{V,\Sigma}(f) := b_\Sigma(P_\Sigma^{V^\perp} f) + d_\Sigma^*(P_\Sigma^V f), \quad \forall f \in \mathcal{H}_\Sigma, \quad (4)$$

where b_Σ, d_Σ^* denote the annihilation and creation operators on the V^\perp and \bar{V} sectors of $\mathcal{F}_c(V, \mathcal{H}_\Sigma)$, respectively. Note that $P_\Sigma^{V^\perp} : \mathcal{H}_\Sigma \rightarrow \bar{V}$ is anti-linear; thus, $\psi_{V,\Sigma}(f)$ is anti-linear in its argument f . The condition under which such a lift $\tilde{U}_{\Sigma',\Sigma}^A$ exists can be inferred from a straight-forward application of Shale and Stinespring's well-known theorem [?]

Theorem 1 (Shale-Stinespring). *The following statements are equivalent:*

- (α) *There is a unitary operator $\tilde{U}_{\Sigma\Sigma'}^A : \mathcal{F}(V, \mathcal{H}_\Sigma) \rightarrow \mathcal{F}(W, \mathcal{H}_{\Sigma'})$ which fulfils (3).*
- (β) *The off-diagonals $P_{\Sigma'}^{W^\perp} U_{\Sigma'\Sigma}^A P_\Sigma^V$ and $P_{\Sigma'}^W U_{\Sigma'\Sigma}^A$ are Hilbert-Schmidt operators.*

Please note that condition (β) for fixed polarisations V, W and general external field A is not always satisfied; see e.g. [?]. However, when carefully adapting the choices of polarisation V to $A|_\Sigma$ and W to $A|_{\Sigma'}$ one can always fulfil condition (β) and therefore construct a lift $\tilde{U}_{\Sigma\Sigma'}^A$, see [?, ?, ?].

Furthermore condition (3) does not fix the phase of the lift $\tilde{U}_{\Sigma\Sigma'}^A$. Considering Bogolyubov's formula

$$j^\mu(x) = i \tilde{U}_{\Sigma_{\text{in}}, \Sigma_{\text{out}}}^A \frac{\delta \tilde{U}_{\Sigma_{\text{out}}, \Sigma_{\text{in}}}^A}{\delta A_\mu(x)}, \quad (5)$$

where $\Sigma_{\text{in}}, \Sigma_{\text{out}}$ are Cauchy-surfaces in the remote past and future, respectively. The current operator thus depends in a rather sensitive way on the phase of \tilde{U}^A . Since the current is experimentally accessible we would like to fix the phase by additional physical constraints. This paper is a step this direction.

Next we introduce the set of four potentials we work with, as well as the argument of a complex number and an invertible bounded operator. For complex numbers the convention we chose here differs slightly from the standard in the literature, which is why we also use a slightly non standard name for this function.

Definition 2 (vector potentials, polar decomposition and spectral projections). *We define the set \mathcal{V} of four potentials*

$$\mathcal{V} := C_c^\infty(\mathbb{R}^4, \mathbb{R}^4). \quad (6)$$

We denote by $\mathcal{H} = L^2(\mathbb{R}^3, \mathbb{C})$. For $X : \mathcal{H} \rightarrow \mathcal{H}$ bounded

$$\text{AG}(X) := X|X|^{-1}. \quad (7)$$

Furthermore, we define for any complex number $z \in \mathbb{C} \setminus \{0\}$

$$\text{ag}(z) := \frac{z}{|z|}. \quad (8)$$

We introduce the standard polarisation for the free Dirac equation

$$P^- := 1_{\text{spec}(H^0) < 0}, \quad P^+ = 1 - P^-. \quad (9)$$

think of some more intuitive notation for the projector.

Definition 3 (scattering operator and phases). We define for all $A, B \in \mathcal{V}$

$$S_{A,B} := U_{\Sigma_{\text{in}}, \Sigma_{\text{out}}}^A U_{\Sigma_{\text{out}}, \Sigma_{\text{in}}}^B, \quad (10)$$

where Σ_{out} and Σ_{int} are Cauchy-surfaces of Minkowski spacetime such that

$$\forall (x, y) \in \text{supp } A \cup \text{supp } B \times \Sigma_{\text{in}} : (x - y)^2 \geq 0 \Rightarrow x^0 > y^0, \quad (11)$$

$$\forall (x, y) \in \text{supp } A \cup \text{supp } B \times \Sigma_{\text{out}} : (x - y)^2 \geq 0 \Rightarrow x^0 < y^0 \quad (12)$$

holds. We choose for all $S_{A,B}$ with $\|\mathbb{1} - S_{A,B}\| < 1$ the lift

$$\bar{S}_{A,B} = \mathcal{R}_{\text{AG}((P^- S_{A,B} P^-)^{-1})} \mathcal{L}_{S_{A,B}}. \quad (13)$$

For $A, B, C \in \mathcal{V}$ such that $\|\mathbb{1} - S_{X,Y}\| < 1$ for $(X, Y) \in \{A, B, C\}$. The complex numbers

$$\gamma_{A,B,C} := \text{ag}_{\mathcal{H}^-}(\det(P^- S_{A,B} P^- S_{B,C} P^- S_{C,A} P^-)), \quad (14)$$

$$\Gamma_{A,B,C} := \text{ag}(\gamma_{A,B,C}). \quad (15)$$

We will see in lemma 1 that $\gamma_{A,B,C} \neq 0$ and $P^- S_{A,B} P^- S_{B,C} P^- S_{C,A} - 1$ is traceclass, so that $\Gamma_{A,B,C}$ is well-defined. Lastly we introduce the partial derivative in the direction of any four-potential F by

$$\partial_F T(F) := \partial_\varepsilon T(\varepsilon F)|_{\varepsilon=0} \quad (16)$$

and for $A, B, C \in \mathcal{V}$ the function

$$c_A(F, G) := -i \partial_F \partial_G \mathfrak{S} \text{tr}[P^- S_{A,A+F} P^+ S_{A,A+G} P^-]. \quad (17)$$

2 Main Result

Definition 4 (causal splitting). We define a causal splitting as a function

$$c^+ : \mathcal{V}^3 \rightarrow \mathbb{C}, \quad (18)$$

$$(A, F, G) \mapsto c_A^+(F, G), \quad (19)$$

such that c^+ restricted to any finite dimensional subspace is smooth in the first argument and linear in the second and third argument. Furthermore c^+ should satisfy

$$c_A(F, G) = c_A^+(F, G) - c_A^+(G, F), \quad (20)$$

$$\partial_H c_{A+H}^+(F, G) = \partial_G c_{A+G}^+(F, H), \quad (21)$$

$$\forall F < G : c_A^+(F, G) = 0. \quad (22)$$

Definition 5 (current). Given a lift $\hat{S}_{A,B}$ of the one-particle scattering operator $S_{A,B}$ for which the derivative in the following expression exists, we define the associated current by Bogolyubov's formula:

$$j_A^{\hat{S}}(F) := i \partial_F \langle \Omega, \hat{S}_{A,A+F} \Omega \rangle. \quad (23)$$

Theorem 2 (existence of causal lift). Given a causal splitting c^+ , there is a second quantised scattering operator \tilde{S} , lift of the one-particle scattering operator S with the following properties

$$\forall A, B, C \in \mathcal{V} : \tilde{S}_{A,B} \tilde{S}_{B,C} = \tilde{S}_{A,C} \quad (24)$$

$$\forall F < G : \tilde{S}_{A,A+F} = \tilde{S}_{A+G,A+F+G} \quad (25)$$

and the associated current satisfies

$$\partial_G j_{A+G}^{\tilde{S}}(F) = \begin{cases} -2i c_A(F, G) & \text{for } G < F \\ 0 & \text{otherwise.} \end{cases} \quad (26)$$

vllt direkt mit S_A definieren, warte ab bis abschätzung der ableitungen geschehen ist

3 Proofs

Since the phase of a lift relative to any other lift is fixed by a single matrix element, we may use the vacuum expectation values to characterise the phase of a lift. The function c captures the dependence of this object on variation of the external fields, the connection between vacuum expectation values and c becomes clearer with the next lemma.

Lemma 1 (properties of Γ). *The function Γ has the following properties for all $A, B, C \in \mathcal{V}$ such that the expressions occurring in each equation are well defined:*

$$\gamma_{A,B,C} \neq 0 \quad (27)$$

$$\Gamma_{A,B,C} = \det_{\mathcal{H}^-} (P^- - P^- S_{A,C} P^+ S_{C,A} P^- - P^- S_{A,B} P^+ S_{B,C} P^- S_{C,A} P^-) \quad (28)$$

$$\Gamma_{A,B,C}^{-1} = \text{ag}(\langle \Omega, \bar{S}_{A,B} \bar{S}_{B,C} \bar{S}_{C,A} \Omega \rangle) \quad (29)$$

$$\Gamma_{A,B,C} = \Gamma_{B,C,A} = \frac{1}{\Gamma_{B,A,C}} \quad (30)$$

$$\Gamma_{A,A,B} = 1 \quad (31)$$

$$\Gamma_{A,B,C} \Gamma_{B,A,D} \Gamma_{A,C,D} \Gamma_{C,B,D} = 1 \quad (32)$$

$$\bar{S}_{A,C} = \Gamma_{A,B,C} \bar{S}_{A,B} \bar{S}_{B,C} \quad (33)$$

$$c_A(B, C) = \partial_B \partial_C \ln \Gamma_{A,A+B,A+C}. \quad (34)$$

Proof. Pick $A, B, C \in \mathcal{V}$ such that $\|1 - S_{X,Y}\| < 1$ for $X, Y \in \{A, B, C\}$. By definition γ is

$$\gamma_{A,B,C} = \det_{\mathcal{H}^-} (P^- S_{A,B} P^- S_{B,C} P^- S_{C,A} P^-). \quad (35)$$

The operator whose determinant we take in the last line is a product

$$P^- S_{A,B} P^- S_{B,C} P^- S_{C,A} P^- = P^- S_{A,B} P^- \quad P^- S_{B,C} P^- \quad P^- S_{C,A} P^-. \quad (36)$$

The three factors appearing in this product are all invertible, hence the product is also invertible as operators of type $\mathcal{H}^- \rightarrow \mathcal{H}^-$ because of the conditions of $\{A, B, C\}$ imply that $\|P^- - P^- S_{X,Y} P^-\| < 1$ which means that the Von Neumann series of the inverse converges, therefore if the determinant exists we have $\gamma_{A,B,C} \neq 0$. To see that it does exist, we reformulate

$$\gamma_{A,B,C} = \det_{\mathcal{H}^-} (P^- S_{A,B} P^- S_{B,C} P^- S_{C,A} P^-) \quad (37)$$

$$= \det_{\mathcal{H}^-} (P^- S_{A,C} P^- S_{C,A} P^- - P^- S_{A,B} P^+ S_{B,C} P^- S_{C,A} P^-) \quad (38)$$

$$= \det_{\mathcal{H}^-} (P^- - P^- S_{A,C} P^+ S_{C,A} P^- - P^- S_{A,B} P^+ S_{B,C} P^- S_{C,A} P^-), \quad (39)$$

now we know by a classic result of Ruisnaars [?] that $P^+ S_{X,Y} P^-$ is a Hilbert-Schmidt operator for our setting, hence γ and also Γ are well defined.

Equation (39) also proves (28). Next we show (29). Borrowing notation from [?, section 2] to identify $\Omega = \bigwedge \Phi$ with the injection $\Phi : \mathcal{H}^- \hookrightarrow \mathcal{H}$ and \bigwedge is used to construct the infinite wedge spaces that are the perspective of Fock space introduced in [?]. We begin

by reformulating the right hand side of (29)

$$\langle \Omega, \bar{S}_{A,B} \bar{S}_{B,C} \bar{S}_{C,A} \Omega \rangle \quad (40)$$

$$= \langle \bigwedge \Phi, \bigwedge (S_{A,B} S_{B,C} S_{C,A} \Phi \text{AG}(P^- S_{C,A} P^-)^{-1} \text{AG}(P^- S_{B,C} P^-)^{-1} \text{AG}(P^- S_{A,B} P^-)^{-1}) \rangle \quad (41)$$

$$= \langle \bigwedge \Phi, \bigwedge (\Phi \text{AG}(P^- S_{C,A} P^-)^{-1} \text{AG}(P^- S_{B,C} P^-)^{-1} \text{AG}(P^- S_{A,B} P^-)^{-1}) \rangle \quad (42)$$

$$= \det_{\mathcal{H}^-} ((\Phi)^* [\Phi \text{AG}(P^- S_{C,A} P^-)^{-1} \text{AG}(P^- S_{B,C} P^-)^{-1} \text{AG}(P^- S_{A,B} P^-)^{-1}]) \quad (43)$$

$$= \det_{\mathcal{H}^-} (\text{AG}(P^- S_{C,A} P^-)^{-1} \text{AG}(P^- S_{B,C} P^-)^{-1} \text{AG}(P^- S_{A,B} P^-)^{-1}) \quad (44)$$

$$= \frac{1}{\det_{\mathcal{H}^-} (\text{AG}(P^- S_{A,B} P^-) \text{AG}(P^- S_{B,C} P^-) \text{AG}(P^- S_{C,A} P^-))}. \quad (45)$$

We first note that $\det_{\mathcal{H}^-} |P^- S_{X,Y} P^-| \in \mathbb{R}^+$ for $X, Y \in \{A, B, C\}$. This is well defined because

$$\langle \Omega, \bar{S}_{X,Y} \Omega \rangle = \langle \bigwedge \Phi, \bigwedge (S_{X,Y} \Phi \text{AG}(P^- S_{X,Y} P^-)^{-1}) \rangle \quad (46)$$

$$= \det_{\mathcal{H}^-} (\Phi^* S_{X,Y} \Phi \text{AG}(P^- S_{X,Y} P^-)^{-1}) = \det_{\mathcal{H}^-} (P^- S_{X,Y} P^- \text{AG}(P^- S_{X,Y} P^-)^{-1}) \quad (47)$$

$$= \det_{\mathcal{H}^-} (\text{AG}(P^- S_{X,Y} P^-)^{-1} P^- S_{X,Y} P^-) \quad (48)$$

$$= \det_{\mathcal{H}^-} (\text{AG}(P^- S_{X,Y} P^-)^{-1} \text{AG}(P^- S_{X,Y} P^-) |P^- S_{X,Y} P^-|) = \det_{\mathcal{H}^-} |P^- S_{X,Y} P^-| \quad (49)$$

holds. Moreover this determinant does not vanish, since the $P^- S_{X,Y} P^-$ is invertible. Also clearly the eigenvalues are positive since $|P^- S_{X,Y} P^-|$ is an absolute value. We continue with the result of (45). Thus, we find

$$\langle \Omega, \bar{S}_{A,B} \bar{S}_{B,C} \bar{S}_{C,A} \Omega \rangle^{-1} = \det_{\mathcal{H}^-} (\text{AG}(P^- S_{A,B} P^-) \text{AG}(P^- S_{B,C} P^-) \text{AG}(P^- S_{C,A} P^-)) \quad (50)$$

$$= \det_{\mathcal{H}^-} (\text{AG}(P^- S_{A,B} P^-) \text{AG}(P^- S_{B,C} P^-) P^- S_{C,A} P^- |P^- S_{C,A} P^-|^{-1}) \quad (51)$$

$$= \det_{\mathcal{H}^-} (\text{AG}(P^- S_{A,B} P^-) \text{AG}(P^- S_{B,C} P^-) P^- S_{C,A} P^-) \det_{\mathcal{H}^-} |P^- S_{C,A} P^-|^{-1} \quad (52)$$

$$= \det_{\mathcal{H}^-} (P^- S_{C,A} P^- \text{AG}(P^- S_{A,B} P^-) \text{AG}(P^- S_{B,C} P^-)) \det_{\mathcal{H}^-} |P^- S_{C,A} P^-|^{-1} \quad (53)$$

$$= \frac{\det_{\mathcal{H}^-} (P^- S_{A,B} P^- P^- S_{B,C} P^- P^- S_{C,A} P^-)}{\det_{\mathcal{H}^-} |P^- S_{A,B} P^-| \cdot \det_{\mathcal{H}^-} |P^- S_{B,C} P^-| \cdot \det_{\mathcal{H}^-} |P^- S_{C,A} P^-|}. \quad (54)$$

Now since the denominator of this fraction is real we can use (28) to identity

$$\text{ag}(\langle \Omega, \bar{S}_{A,B} \bar{S}_{B,C} \bar{S}_{C,A} \Omega \rangle) = \Gamma_{A,B,C}^{-1}, \quad (55)$$

which proves (29).

For the first equality in (30) we use $\det X(1+Y)X^{-1} = \det(1+Y)$ for any Y trace-class and X bounded and invertible. So we can cyclicly permute the factors $P^- S_{X,Y} P^-$ in the determinant and find

$$\begin{aligned} \Gamma_{A,B,C} &= \text{ag}(\det_{\mathcal{H}^-} P^- S_{A,B} P^- S_{B,C} P^- S_{C,A} P^-) \\ &= \text{ag}(\det_{\mathcal{H}^-} P^- S_{C,A} P^- S_{A,B} P^- S_{B,C} P^-) = \Gamma_{C,A,B}. \end{aligned}$$

For the second equality of (30) we use (28) to represent both $\Gamma_{A,B,C}$ and $\Gamma_{B,A,C}$. Using this and the manipulations of the determinant we already employed, we arrive at

$$\Gamma_{A,B,C}\Gamma_{B,A,C} \quad (56)$$

$$= \text{ag}(\det_{\mathcal{H}^-}(P^- S_{A,B} P^- S_{B,C} P^- S_{C,A} P^-)) \quad (57)$$

$$\times \text{ag}(\det_{\mathcal{H}^-}(P^- S_{B,A} P^- S_{A,C} P^- S_{C,B} P^-)) \quad (58)$$

$$= \text{ag}(\det_{\mathcal{H}^-}(P^- S_{A,B} P^- S_{B,C} P^- S_{C,A} P^-)) \quad (59)$$

$$\times (\text{ag}(\det_{\mathcal{H}^-}(P^- S_{B,C} P^- S_{C,A} P^- S_{A,B} P^-)))^* \quad (60)$$

$$= \text{ag}(\det_{\mathcal{H}^-}(P^- S_{A,B} P^- S_{B,C} P^- S_{C,A} P^-)) \quad (61)$$

$$\times (\text{ag}(\det_{\mathcal{H}^-}(P^- S_{A,B} P^- S_{B,C} P^- S_{C,A} P^-)))^* \quad (62)$$

$$= |\text{ag}(\det_{\mathcal{H}^-}(P^- S_{A,B} P^- S_{B,C} P^- S_{C,A} P^-))|^2 = 1, \quad (63)$$

which proves (30).

Next, using (14) inserting twice the same argument yields

$$\gamma_{A,A,C} = \det_{\mathcal{H}^-} P^- S_{A,C} P^- S_{C,A} P^- = \det_{\mathcal{H}^-} (P^- S_{C,A} P^-)^* P^- S_{C,A} P^- \in \mathbb{R}^+, \quad (64)$$

hence (31) follows.

For proving (32) we will use the definition of Γ directly and repeatedly use that we can cyclicly permute operator groups of the form $P^- S_{X,Y} P^-$ for $X, Y \in \{A, B, C, D\}$ in the determinant, i.e.

$$\det P^- S_{X,Y} P^- O = \det O P^- S_{X,Y} P^-. \quad (\mathcal{C})$$

This is possible, because $P^- S_{X,Y} P^-$ is bounded and invertible. Furthermore we will use that

$$\det O_1 O_2 = \det O_1 \det O_2 \quad (\leftrightarrow)$$

holds whenever both O_1 and O_2 have a determinant. Moreover for any $(P^- S_{X,Y} P^-)^* P^- S_{X,Y} P^-$ is the modulus squared of an invertible operator and hence its determinant is positive which means that

$$\text{ag} \det (P^- S_{X,Y} P^-)^* P^- S_{X,Y} P^- = 1. \quad (\text{ag} | \cdot |)$$

These three rules will be repeatedly used. We calculate

$$\Gamma_{A,B,C}\Gamma_{B,A,D}\Gamma_{A,C,D}\Gamma_{C,B,D} \quad (65)$$

$$= \text{ag det}_{\mathcal{H}^-} P^- S_{A,B} P^- S_{B,C} P^- S_{C,A} P^- \text{ag det}_{\mathcal{H}^-} P^- S_{B,A} P^- S_{A,D} P^- S_{D,B} P^- \Gamma_{A,C,D}\Gamma_{C,B,D} \quad (66)$$

$$\stackrel{(\odot)}{=} \text{ag det}_{\mathcal{H}^-} P^- S_{A,D} P^- S_{D,B} P^- S_{B,A} P^- \text{ag det}_{\mathcal{H}^-} P^- S_{A,B} P^- S_{B,C} P^- S_{C,A} P^- \Gamma_{A,C,D}\Gamma_{C,B,D} \quad (67)$$

$$\stackrel{(\leftrightarrow)}{=} \text{ag det}_{\mathcal{H}^-} P^- S_{A,D} P^- S_{D,B} [P^- S_{B,A} P^- S_{A,B} P^-] S_{B,C} P^- S_{C,A} P^- \Gamma_{A,C,D}\Gamma_{C,B,D} \quad (68)$$

$$\stackrel{(\odot)}{=} \text{ag det}_{\mathcal{H}^-} P^- S_{B,C} P^- S_{C,A} P^- S_{A,D} P^- S_{D,B} [P^- S_{B,A} P^- S_{A,B} P^-] \Gamma_{A,C,D}\Gamma_{C,B,D} \quad (69)$$

$$\stackrel{(\leftrightarrow)}{=} \text{ag det}_{\mathcal{H}^-} P^- S_{B,C} P^- S_{C,A} P^- S_{A,D} P^- S_{D,B} P^- \text{ag det}_{\mathcal{H}^-} P^- S_{B,A} P^- S_{A,B} P^- \Gamma_{A,C,D}\Gamma_{C,B,D} \quad (70)$$

$$\stackrel{(\text{ag}|)}{=} \text{ag det}_{\mathcal{H}^-} P^- S_{B,C} P^- S_{C,A} P^- S_{A,D} P^- S_{D,B} P^- \Gamma_{A,C,D}\Gamma_{C,B,D} \quad (71)$$

$$\stackrel{(\odot)}{=} \text{ag det}_{\mathcal{H}^-} P^- S_{A,D} P^- S_{D,B} P^- S_{B,C} P^- S_{C,A} P^- \Gamma_{A,C,D}\Gamma_{C,B,D} \quad (72)$$

$$= \text{ag det}_{\mathcal{H}^-} P^- S_{A,C} P^- S_{C,D} P^- S_{D,A} P^- \text{ag det}_{\mathcal{H}^-} P^- S_{A,D} P^- S_{D,B} P^- S_{B,C} P^- S_{C,A} P^- \Gamma_{C,B,D} \quad (73)$$

$$\stackrel{(\leftrightarrow)}{=} \text{ag det}_{\mathcal{H}^-} P^- S_{A,C} P^- S_{C,D} P^- [P^- S_{D,A} P^- P^- S_{A,D} P^-] S_{D,B} P^- S_{B,C} P^- S_{C,A} P^- \Gamma_{C,B,D} \quad (74)$$

$$\stackrel{(\odot)}{=} \text{ag det}_{\mathcal{H}^-} P^- S_{D,B} P^- S_{B,C} P^- S_{C,A} P^- S_{A,C} P^- S_{C,D} P^- [P^- S_{D,A} P^- P^- S_{A,D} P^-] \Gamma_{C,B,D} \quad (75)$$

$$\stackrel{(\leftrightarrow)}{=} \text{ag det}_{\mathcal{H}^-} P^- S_{D,B} P^- S_{B,C} P^- S_{C,A} P^- S_{A,C} P^- S_{C,D} P^- \text{ag det}_{\mathcal{H}^-} P^- S_{D,A} P^- P^- S_{A,D} P^- \Gamma_{C,B,D} \quad (76)$$

$$\stackrel{(\text{ag}|)}{=} \text{ag det}_{\mathcal{H}^-} P^- S_{D,B} P^- S_{B,C} P^- [P^- S_{C,A} P^- S_{A,C} P^-] P^- S_{C,D} P^- \Gamma_{C,B,D} \quad (77)$$

$$\stackrel{(\odot)}{=} \text{ag det}_{\mathcal{H}^-} P^- S_{C,D} P^- S_{D,B} P^- S_{B,C} P^- [P^- S_{C,A} P^- S_{A,C} P^-] \Gamma_{C,B,D} \quad (78)$$

$$\stackrel{(\leftrightarrow)}{=} \text{ag det}_{\mathcal{H}^-} P^- S_{C,D} P^- S_{D,B} P^- S_{B,C} P^- \text{ag det}_{\mathcal{H}^-} P^- S_{C,A} P^- S_{A,C} P^- \Gamma_{C,B,D} \quad (79)$$

$$\stackrel{(\text{ag}|)}{=} \text{ag det}_{\mathcal{H}^-} P^- S_{C,D} P^- S_{D,B} P^- S_{B,C} P^- \Gamma_{C,B,D} \quad (80)$$

$$= \text{ag det}_{\mathcal{H}^-} P^- S_{C,D} P^- S_{D,B} P^- S_{B,C} P^- \text{ag det}_{\mathcal{H}^-} P^- S_{C,B} P^- S_{B,D} P^- S_{D,C} P^- \quad (81)$$

$$= |\text{ag det}_{\mathcal{H}^-} P^- S_{C,D} P^- S_{D,B} P^- S_{B,C} P^-|^2 = 1. \quad (82)$$

For (33) we realise that according to [?] that two lifts can only differ by a phase, that is

$$\bar{S}_{A,C} = \alpha \bar{S}_{A,B} \bar{S}_{B,C} \quad (83)$$

for some $\alpha \in \mathbb{C}$, $|\alpha| = 1$.

In order to identify α we recognise that $\bar{S}_{X,Y} = \bar{S}_{Y,X}^{-1}$ for four potentials X, Y and find

$$\mathbf{1}\alpha^{-1} = \bar{S}_{A,B} \bar{S}_{B,C} \bar{S}_{C,A}. \quad (84)$$

Now we take the vacuum expectation value on both sides of this equation and use (29) to find

$$\alpha^{-1} = \langle \Omega, \bar{S}_{A,B} \bar{S}_{B,C} \bar{S}_{C,A} \Omega \rangle = \Gamma_{A,B,C}^{-1}. \quad (85)$$

Finally we prove (34). We start from the right hand side of this equation and work our way towards the left hand side of it. In the following calculation we will repeatedly make use of the fact that $(P^- S_{A,A+B} P^- S_{A+B,A} P^-)$ is the absolute value squared of an invertible operator and has a determinant, which is therefore positive. For the marked equality we will use that for a differentiable function $z : \mathbb{R} \rightarrow \mathbb{C}$ at points t where $z(t) \in \mathbb{R}^+$ holds, we have

$$(z/|z|)'(t) = \frac{z'}{|z|}(t) + \frac{-z}{|z|^2} \frac{z' z^* + z^{*'} z}{2|z|}(t) = \frac{z'}{2|z|}(t) - \frac{z^2 z^{*'}}{2|z|^3}(t) = i(\Im(z'))/z(t). \quad (86)$$

Furthermore, we will use the following expressions for the derivative of the determinant which holds for all functions $M : \mathbb{R} \rightarrow (\mathcal{H} \rightarrow \mathcal{H})$ such that $M(t) - 1$ is traceclass and M is invertible for all $t \in \mathbb{R}$

$$\partial_\varepsilon \det M(\varepsilon)|_{\varepsilon=0} = \det M(0) \operatorname{tr}(M^{-1}(0) \partial_\varepsilon M(\varepsilon)|_{\varepsilon=0}), \quad (87)$$

likewise we need the following expression for the derivative of M^{-1} for $M : \mathbb{R} \rightarrow (\mathcal{H} \rightarrow \mathcal{H})$ such that $M(t)$ is invertible and bounded for every $t \in \mathbb{R}$

$$\partial_\varepsilon M^{-1}(\varepsilon)|_{\varepsilon=0} = -M^{-1}(0) \partial_\varepsilon M(\varepsilon)|_{\varepsilon=0} M^{-1}(0). \quad (88)$$

We compute

$$\partial_B \partial_C \ln \Gamma_{A,A+B,A+C} \stackrel{(28)}{=} \partial_B \partial_C \ln \operatorname{ag}(\det_{\mathcal{H}^-}(P^- S_{A,A+B} P^- S_{A+B,A+C} P^- S_{A+C,A} P^-)) \quad (89)$$

$$= \partial_B \frac{\partial_C \operatorname{ag}(\det_{\mathcal{H}^-}(P^- S_{A,A+B} P^- S_{A+B,A+C} P^- S_{A+C,A} P^-))}{\operatorname{ag}(\det_{\mathcal{H}^-}(P^- S_{A,A+B} P^- S_{A+B,A} P^-))} \quad (90)$$

$$= \partial_B \partial_C \operatorname{ag}(\det_{\mathcal{H}^-}(P^- S_{A,A+B} P^- S_{A+B,A+C} P^- S_{A+C,A} P^-)) \quad (91)$$

$$\stackrel{*}{=} i \partial_B \frac{\Im \partial_C \det_{\mathcal{H}^-}(P^- S_{A,A+B} P^- S_{A+B,A+C} P^- S_{A+C,A} P^-)}{\det_{\mathcal{H}^-}(P^- S_{A,A+B} P^- S_{A+B,A} P^-)} \quad (92)$$

$$= i \partial_B \left[\frac{\det_{\mathcal{H}^-}(P^- S_{A,A+B} P^- S_{A+B,A} P^-)}{\det_{\mathcal{H}^-}(P^- S_{A,A+B} P^- S_{A+B,A} P^-)} \right] \times \Im \operatorname{tr}((P^- S_{A,A+B} P^- S_{A+B,A} P^-)^{-1} \partial_C P^- S_{A,A+B} P^- S_{A+B,A+C} P^- S_{A+C,A} P^-) \quad (93)$$

The fraction in front of the trace equals 1. As a next step we replace the second but last projector $P^- = 1 - P^+$, the resulting first summand vanishes, because the dependence on C cancels. This results in

$$(93) = -i \partial_B \Im \operatorname{tr}((P^- S_{A,A+B} P^- S_{A+B,A} P^-)^{-1} \partial_C P^- S_{A,A+B} P^- S_{A+B,A+C} P^+ S_{A+C,A} P^-). \quad (94)$$

Now, because $P^+ P^- = 0$ only one summand of the product rule survives:

$$(94) = -i \partial_B \Im \operatorname{tr}((P^- S_{A,A+B} P^- S_{A+B,A} P^-)^{-1} \partial_C P^- S_{A,A+B} P^- S_{A+B,A} P^+ S_{A+C,A} P^-). \quad (95)$$

Next we use $(MN)^{-1} = N^{-1}M^{-1}$ for invertible operators M and N for the first factor in the trace and cancel as much as possible of the second factor:

$$(95) = -i\partial_B \Im \operatorname{tr}((P^- S_{A+B,A} P^-)^{-1} P^- S_{A+B,A} P^+ \partial_C S_{A+C,A} P^-) \quad (96)$$

$$= -i\Im \operatorname{tr}(\partial_B [(P^- S_{A+B,A} P^-)^{-1} P^- S_{A+B,A} P^+ \partial_C S_{A+C,A} P^-]) \quad (97)$$

$$= -i\Im \operatorname{tr}(\partial_B P^- S_{A+B,A} P^+ \partial_C S_{A+C,A} P^-) \quad (98)$$

$$= -i\Im \operatorname{tr}(\partial_B P^- S_{A,A+B} P^+ \partial_C S_{A,A+C} P^-) \quad (99)$$

$$= -i\partial_B \partial_C \Im \operatorname{tr}(P^- S_{A,A+B} P^+ S_{A,A+C} P^-) \quad (100)$$

which proves the claim. \square

In order to construct the lift announced in theorem 2, we first construct a reference lift \hat{S} , that is well defined on all of \mathcal{V} . Afterwards we will study the dependence of the relative phase between this global lift $\hat{S}_{0,A}$ and a local lift given by $\hat{S}_{0,B} \bar{S}_{B,A}$ for $B - A$ small. By exploiting properties of this phase and the causal splitting c^+ we will construct a global lift that has the desired properties.

Since \mathcal{V} is star shaped, we may reach any four-potential A from 0 through the straight line $\{tA \mid t \in [0, 1]\}$.

Definition 6 (global lift). *For any $A, B \in \mathcal{V}$ and any two lifts $S'_{A,B}, S''_{A,B}$ of the one particle scattering operator $S_{A,B}$ we define the ratio*

$$\frac{S'_{A,B}}{S''_{A,B}} \in S^1 \quad (101)$$

to be the unique complex number $z \in S^1$ such that

$$z S''_{A,B} = S'_{A,B} \quad (102)$$

holds. Furthermore, for any $A \in \mathcal{V}$ we define the lift $\hat{S}_{0,A}$ as the unique solution of the differential equation

$$\underbrace{c_1}_{\text{S.t. } \exists S_{c_1 A}, \overline{S_{c_1 A+B}}} A, B \in \mathcal{V} \text{ linearly dependent} \Rightarrow \partial_B \frac{\hat{S}_{0,A+B}}{\hat{S}_{0,A} \bar{S}_{A,A+B}} = 0, \quad (103)$$

subject to the initial condition $\hat{S}_{0,0} = 1$.

Definition 7 (relative phase). *Let $A, B \in \mathcal{V}$ such that $\|1 - S_{A,B}\| < 1$ holds. We define $\theta_{A,B} \in [-\pi, \pi[$ by*

$$e^{i\theta_{A,B}} := \frac{\hat{S}_{0,B}}{\hat{S}_{0,A} \bar{S}_{A,B}}. \quad (104)$$

Please note that for such A, B the lift $\bar{S}_{A,B}$ is well defined. This means that the product in the denominator is a lift of $S_{0,B}$ and according to def 6 the ratio is well defined.

Lemma 2 (properties of the relative phase). *For all $A, F, G \in \mathcal{V}$ such that $\|1 - S_{A,F}\| < 1, \|1 - S_{F,G}\| < 1, \|1 - S_{A,G}\| < 1$ hold, as well as for all $H, K \in \mathcal{V}$, we have*

$$\theta_{A,F} = -\theta_{F,A} \quad (105)$$

$$e^{i(\theta_{F,A} + \theta_{A,G} + \theta_{G,F})} = \Gamma_{F,A,G} \quad (106)$$

$$i\partial_{\varepsilon_1} \partial_{\varepsilon_2} \theta_{A+\varepsilon_1 H, A+\varepsilon_2 K} = c_A(H, K). \quad (107)$$

$$\hat{S}_{0,A} = \hat{S}_{0,C} \bar{S}_{C,A} \overset{S'}{Z}_{C,A}$$

$$\begin{aligned} \partial_B \frac{\hat{S}_{0,A+B}}{\hat{S}_{0,A} \bar{S}_{A,A+B}} &= \partial_B \frac{\hat{S}_{0,C} \bar{S}_{C,A+B} Z_{C,A+B}}{\hat{S}_{0,C} \bar{S}_{C,A} Z_{C,A} \bar{S}_{A,A+B}} \\ &= \partial_B \frac{\Gamma_{C,A,A+B} Z_{C,A+B}}{Z_{C,A}} \stackrel{!}{=} 0 \end{aligned}$$

$$B = SA$$

$$\partial_\varepsilon \ln \Gamma_{C,SA,(1+\varepsilon)SA} + \partial_\varepsilon \ln \frac{Z_{C,(1+\varepsilon)SA}}{Z_{C,SA}} = 0$$

$$\overset{Z_{C,SA}}{\partial_\varepsilon \ln \Gamma_{C,SA,(1+\varepsilon)SA}} + \partial_\varepsilon \ln \frac{Z_{C,(1+\varepsilon)SA}}{Z_{C,SA}} = 0$$

$$\overset{Z_{C,C}=1}{\frac{d}{dx} \ln Z_{C,SA}} = \left(- \frac{d}{dx} \ln \Gamma_{C,SA,SA} \right) \Big|_{y=x}$$

$$Z_{A,SA} = e^{-\int_1^x dx' \left(\frac{d}{dx'} \ln \Gamma_{A,x'A,x''A} \right)_{x''=x'}}$$

Nenne Differentialgl. im Text. Gib eindeutige Lösung an.

$$Z_{A \times A} \cdot Z_{tA, \times A}$$

$$\hat{S}_{0A} = \hat{\int}_{0,c} \overline{\int}_{c,A} \overset{S'}{\psi} Z_{c,A} \quad) \quad \hat{S}_{0A} = \hat{\int}_{0,c} \overline{\int}_{c,A} \overset{S'}{\psi} Z_{c,A}$$

$$= \hat{\int}_{0,c} \overline{\int}_{c,c} Z_{c,c} \overline{\int}_{c,A} Z_{c,A}$$

$$= \hat{\int}_{0,c} \overline{\int}_{c,A} \Gamma_{c,tc,A}^{-1} Z_{c,A} Z_{c,c}$$

$$Z_{c,A} = \Gamma_{c,tc,A}^{-1} Z_{c,A} Z_{c,c}$$

$$C_A(B,C)=\partial_B\partial_C\ln\Gamma\{A,A+B,A+C\}$$

Proof. Pick $A, F, G \in \mathcal{V}$ as in the lemma. We start off by analysing

$$\hat{S}_{0,F} \bar{S}_{F,G} \stackrel{(104)}{=} e^{i\theta_{A,F}} \hat{S}_{0,A} \bar{S}_{A,F} \bar{S}_{F,G} \quad (108)$$

$$\stackrel{(33)}{=} e^{i\theta_{A,F}} \Gamma_{A,F,G}^{-1} \hat{S}_{0,A} \bar{S}_{A,G}. \quad (109)$$

Exchanging A and F in this equation yields

$$\hat{S}_{0,A} \bar{S}_{A,G} = e^{i\theta_{F,A}} \Gamma_{F,A,G}^{-1} \hat{S}_{0,F} \bar{S}_{F,G}. \quad (110)$$

This is equivalent to

$$\hat{S}_{0,F} \bar{S}_{F,G} = e^{-i\theta_{F,A}} \Gamma_{F,A,G} \hat{S}_{0,A} \bar{S}_{A,G}, \quad (111)$$

taking (30) into account this means that

$$\theta_{A,F} = -\theta_{F,A} \quad (112)$$

holds true. Equation (109) solved for $\hat{S}_{0,A} \bar{S}_{A,G}$ also gives us

$$\hat{S}_{0,G} \stackrel{(104)}{=} e^{i\theta_{A,G}} \hat{S}_{0,A} \bar{S}_{A,G} \stackrel{(109)}{=} e^{i\theta_{A,G}} e^{-i\theta_{A,F}} \Gamma_{A,F,G} \hat{S}_{0,F} \bar{S}_{F,G}. \quad (113)$$

The latter equation compared with

$$\hat{S}_{0,G} \stackrel{(104)}{=} e^{i\theta_{F,G}} \hat{S}_{0,F} \bar{S}_{F,G}, \quad (114)$$

yields a direct connection between Γ and θ :

$$e^{i\theta_{A,G} - i\theta_{A,F}} \Gamma_{A,F,G} = e^{i\theta_{F,G}}, \quad (115)$$

or by (105)

$$\Gamma_{A,F,G} = e^{i\theta_{F,G} + i\theta_{A,F} + i\theta_{G,A}}. \quad (116)$$

Finally, in this equation we replace $F = A + \varepsilon_1 H$ as well as $G = A + \varepsilon_2 K$, where $\varepsilon_1, \varepsilon_2$ is small enough so that θ and Γ are still well defined. Then we take the logarithm and derivatives to find

$$i\partial_{\varepsilon_1} \partial_{\varepsilon_2} \theta_{A+\varepsilon_1 H, A+\varepsilon_2 K} = \partial_{\varepsilon_1} \partial_{\varepsilon_2} \ln \Gamma_{A, A+\varepsilon_1 H, A+\varepsilon_2 K} \stackrel{(34)}{=} c_A(H, K). \quad (117)$$

□

So we find that c is the mixed derivative of θ . In the following we will characterise θ more thoroughly by c and c^+ .

Definition 8 (p-forms of four potentials, phase integral). *We introduce for $p \in \mathbb{N}$*

$$\begin{aligned} \Omega^p &:= \{\omega : \mathcal{V}^{p+1} \rightarrow \mathbb{C} \mid \forall \sigma \in S^p, \alpha \in \mathbb{R}, A_1, \dots, A_{p+1} \in \mathcal{V} : \\ &\quad \omega(A_1, \alpha A_{\sigma(1)}, \dots, A_{\sigma(p)}) = \text{sgn}(\sigma) \alpha \omega(A_1, A_2, \dots, A_p)\}, \end{aligned} \quad (118)$$

where $\text{sgn}(\sigma)$ is the sign of the permutation σ . We define the one form $\chi \in \Omega^1(\mathcal{V})$ by

$$\chi_A(B) := \partial_B \theta_{A, A+B} \quad (119)$$

for all $A, B \in \mathcal{V}$. Furthermore for a differential form $\omega \in \Omega^p(\mathcal{V})$ for some $p \in \mathbb{N}$ we define the exterior derivative of ω , $d\omega \in \Omega^{p+1}(\mathcal{V})$ by

$$(d\omega)_A(B_1, \dots, B_{p+1}) := \sum_{k=1}^{p+1} (-1)^{k+1} \partial_{B_k} \omega_{A+B_k}(B_1, \dots, \cancel{B_k}, \dots, B_{p+1}), \quad (120)$$

for general $A, B_1, \dots, B_{p+1} \in \mathcal{V}$, where the notation $\cancel{B_k}$ denotes that B_k is not to be inserted as an argument.

Lemma 3 (connection between c and the relative phase). *The differential form χ fulfils*

$$(d\chi)_A(F, G) = -2ic_A(F, G) \quad (121)$$

for all $A, F, G \in \mathcal{V}$.

Proof. Pick $A, F, G \in \mathcal{V}$, we calculate

$$(d\omega)_A(F, G) = \partial_F \partial_G \theta_{A+F, A+F+G} - \partial_F \partial_G \theta_{A+G, A+F+G} \quad (122)$$

$$= \partial_F \partial_G (\theta_{A, A+F+G} + \theta_{A+F, A+G}) - \partial_F \partial_G (\theta_{A, A+F+G} + \theta_{A+G, A+F}) \quad (123)$$

$$\stackrel{(105)}{=} 2\partial_F \partial_G \theta_{A+F, A+G} \stackrel{(107)}{=} -2ic_A(F, G). \quad (124)$$

□

Now since $dc = 0$, we might use Poincaré's lemma as a method independent of θ to construct a differential form ω such that $d\omega = c$. In order to execute this plan, we first need to prove Poincaré's lemma for our setting:

Lemma 4 (Poincaré). *Let $\omega \in \Omega^p(\mathcal{V})$ for $p \in \mathbb{R}$ be closed, i.e. $d\omega = 0$. Then ω is also exact, more precisely we have*

$$\omega = d \int_0^1 \iota_t^* i_X f^* \omega dt, \quad (125)$$

where X, ι_t for $t \in \mathbb{R}$ and f are given by

$$X : \mathbb{R} \times \mathcal{V} \rightarrow \mathbb{R} \times \mathcal{V}, \quad (126)$$

$$(t, B) \mapsto (1, 0) \quad (127)$$

$$\forall t \in \mathbb{R} : \iota_t : \mathcal{V} \rightarrow \mathbb{R} \times \mathcal{V}, \quad (128)$$

$$B \mapsto (t, B) \quad (129)$$

$$f : \mathbb{R} \times \mathcal{V} \mapsto \mathcal{V}, \quad (130)$$

$$(t, B) \mapsto tB \quad (131)$$

$$\forall t \in \mathbb{R} : f_t := f(t, \cdot). \quad (132)$$

Proof. Pick some $\omega \in \Omega^p(\mathcal{V})$. We will first show the more general formula

$$f_b^* \omega - f_a^* \omega = d \int_a^b \iota_t^* i_X f^* \omega dt + \int_a^b \iota_t^* i_X f^* d\omega dt. \quad (133)$$

The lemma follows then by $b = 1, a = 0, f_1^* \omega = \omega, f_0^* \omega = 0$ and $d\omega = 0$ for a closed ω . We begin by rewriting the right hand side of (133):

$$d \int_a^b \iota_t^* i_X f^* \omega dt + \int_a^b \iota_t^* i_X f^* d\omega dt = \int_a^b (d\iota_t^* i_X f^* \omega + \iota_t^* i_X f^* d\omega) dt. \quad (134)$$

Next we look at both of these terms separately. Let therefore $p \in \mathbb{N}, t, s_k \in \mathbb{R}$ and

$A, B_k \in \mathcal{V}$ for each $p+1 \geq k \in \mathbb{N}$. First, we calculate $dl_t^* i_X f^* \omega$

$$(f^* \omega)_{(t,A)}((s_1, B_1), \dots, (s_p, B_p)) = \omega_{tA}(s_1 A + tB_1, \dots, s_p A + tB_p) \quad (135)$$

$$(i_X f^* \omega)_{(t,A)}((s_1, B_1), \dots, (s_{p-1}, B_{p-1})) = \omega_{tA}(A, s_1 A + tB_1, \dots, s_{p-1} A + tB_{p-1}) \quad (136)$$

$$(\iota_t^* i_X f^* \omega)_A(B_1, \dots, B_{p-1}) = t^{p-1} \omega_{tA}(A, B_1, \dots, B_{p-1}) \quad (137)$$

$$\begin{aligned} (dl_t^* i_X f^* \omega)_A(B_1, \dots, B_p) &= \partial_\varepsilon|_{\varepsilon=0} \sum_{k=1}^p (-1)^{k+1} t^{p-1} \omega_{tA+\varepsilon tB_k}(A, B_1, \dots, \cancel{B_k}, \dots, B_p) \\ &+ \partial_\varepsilon|_{\varepsilon=0} \sum_{k=1}^p (-1)^{k+1} t^{p-1} \omega_{tA}(A + \varepsilon B_k, B_1, \dots, \cancel{B_k}, \dots, B_p) \end{aligned} \quad (138)$$

$$= \partial_\varepsilon|_{\varepsilon=0} \sum_{k=1}^p t^p (-1)^{k+1} \omega_{tA+\varepsilon B_k}(A, B_1, \dots, \cancel{B_k}, \dots, B_p) + p t^{p-1} \omega_{tA}(B_1, \dots, B_p). \quad (139)$$

Now, we calculate $\iota_t^* i_X f^* d\omega$:

$$(d\omega)_A(B_1, \dots, B_{p+1}) = \partial_\varepsilon|_{\varepsilon=0} \sum_{k=1}^{p+1} (-1)^{k+1} \omega_{A+\varepsilon B_k}(B_1, \dots, \cancel{B_k}, \dots, B_{p+1}) \quad (140)$$

$$(f^* d\omega)_{(t,A)}((s_1, B_1), \dots, (s_{p+1}, B_{p+1})) = (d\omega)_{tA}(s_1 A + tB_1, \dots, s_{p+1} A + tB_{p+1}) \quad (141)$$

$$= \partial_\varepsilon|_{\varepsilon=0} \sum_{k=1}^{p+1} (-1)^{k+1} \omega_{tA+\varepsilon(s_k A + tB_k)}(s_1 A + tB_1, \dots, \cancel{s_k A + tB_k}, \dots, s_p A + tB_p) \quad (142)$$

$$(i_X f^* d\omega)_{(t,A)}((s_1, B_1), \dots, (s_p, B_p)) = \partial_\varepsilon|_{\varepsilon=0} \omega_{(t+\varepsilon)A}(s_1 A + tB_1, \dots, s_p A + tB_p) \quad (143)$$

$$+ \partial_\varepsilon|_{\varepsilon=0} \sum_{k=1}^p (-1)^k \omega_{tA+\varepsilon(s_k A + tB_k)}(A, s_1 A + tB_1, \dots, \cancel{s_k A + tB_k}, \dots, s_p A + tB_p) \quad (144)$$

$$= t^p \partial_\varepsilon|_{\varepsilon=0} \omega_{(t+\varepsilon)A}(B_1, \dots, \cancel{B_k}, \dots, B_p) \quad (145)$$

$$+ \sum_{k=1}^p s_k t^{p-1} (-1)^{k+1} \partial_\varepsilon|_{\varepsilon=0} \omega_{(t+\varepsilon)A}(A, B_1, \dots, B_p) \quad (146)$$

$$+ \partial_\varepsilon|_{\varepsilon=0} \sum_{k=1}^p (-1)^k t^{p-1} (\omega_{(t+s_k \varepsilon)A}(A, B_1, \dots, \cancel{B_k}, \dots, B_p) \quad (147)$$

$$+ \omega_{tA+\varepsilon tB_k}(A, B_1, \dots, \cancel{B_k}, \dots, B_p)) \quad (148)$$

$$= t^p \partial_\varepsilon|_{\varepsilon=0} \left(\omega_{(t+\varepsilon)A}(B_1, \dots, B_p) + \sum_{k=1}^p (-1)^k \omega_{tA+\varepsilon B_k}(A, B_1, \dots, \cancel{B_k}, \dots, B_p) \right) \quad (149)$$

$$(\iota_t^* i_X f^* d\omega)_A(B_1, \dots, B_p) = t^p \partial_\varepsilon|_{\varepsilon=0} \left(\omega_{(t+\varepsilon)A}(B_1, \dots, B_p) \quad (150)$$

$$+ \sum_{k=1}^p (-1)^k \omega_{tA+\varepsilon B_k}(A, B_1, \dots, \cancel{B_k}, \dots, B_p) \right) \quad (151)$$

Adding (139) and (151) we find for (134):

$$\int_a^b (d\iota_t^* i_X f^* \omega + \iota_t^* i_X f^* d\omega) dt = \quad (152)$$

$$\int_a^b \left(t^p \partial_\varepsilon|_{\varepsilon=0} \omega_{(t+\varepsilon)A}(B_1, \dots, B_p) + p t^{p-1} \omega_{tA}(B_1, \dots, B_p) \right) dt \quad (153)$$

$$= \int_a^b \frac{d}{dt} (t^p \omega_{tA}(B_1, \dots, B_p)) dt = \int_a^b \frac{d}{dt} (f_t^* \omega)_A(B_1, \dots, B_p) dt \quad (154)$$

$$= (f_b^* \omega)_A(B_1, \dots, B_p) - (f_a^* \omega)_A(B_1, \dots, B_p). \quad (155)$$

□

Definition 9 (integral of a closed p form). *For a closed exterior form $\omega \in \Omega^p(\mathcal{V})$ we define the form $\prod[\omega]$*

$$\prod[\omega] := \int_0^1 \iota_t^* i_X f^* \omega dt. \quad (156)$$

For $A, B_1, \dots, B_{p-1} \in \mathcal{V}$ it takes the form

$$\prod[\omega]_A(B_1, \dots, B_p) = \int_0^1 t^{p-1} \omega_{tA}(A, B_1, \dots, B_{p-1}) dt. \quad (157)$$

By lemma 4 we know $d \prod[\omega] = \omega$ if $d\omega = 0$.

Now we found two one forms each produces c when the exterior derivative is taken. The next lemma informs us about their relationship.

Lemma 5 (inversion of lemma 3). *The following equality holds*

$$\chi = -2i \prod[c]. \quad (158)$$

Proof. We have $d(\chi + 2i \prod[c]) = 0$ so by lemma 4 we know that there is $v : \mathcal{V} \rightarrow \mathbb{R}$ such that

$$dv = \chi + 2i \prod[c] \quad (159)$$

holds. Now (103) translates into the following ODE for θ :

$$\partial_B \theta_{0,B} = 0, \quad \partial_B \theta_{A,A+B}|_{A=B} = 0 \quad (160)$$

for all $A, B \in \mathcal{V}$. This means that

$$\chi_0(B) = 0 = \prod[c]_0(B), \quad \chi_{A,A} = 0 = \prod[c]_A(A) \quad (161)$$

hold. This implies

$$\partial_\varepsilon v_{\varepsilon A} = 0, \quad \partial_\varepsilon v_{A+\varepsilon A} = 0, \quad (162)$$

which means that v is constant. □

From this point on we will assume the existence of a function c^+ fulfilling (20),(21) and (22). Recall equation (21):

$$\forall A, F, G, H : \partial_H c_{A+H}^+(F, G) = \partial_G c_{A+G}^+(F, H). \quad (163)$$

For a fixed $F \in \mathcal{V}$, this condition can be read as $d(c^+(F, \cdot)) = 0$. As a consequence we can apply lemma 4 to define a one form.

Definition 10 (integral of the causal splitting). *For any $F \in \mathcal{V}$, we define*

$$\beta_A(F) := 2i \prod [c^+(F, \cdot)]_A. \quad (164)$$

Lemma 6 (relation between the integral of the causal splitting and the phase integral). *The following two equations hold:*

$$d\beta = -2ic \quad (165)$$

$$d(\beta - \chi) = 0. \quad (166)$$

Proof. We start with the exterior derivative of β . Pick $A, F, G \in \mathcal{V}$:

$$d\beta_A(F, G) = \partial_F \beta_{A+F}(G) - \partial_G \beta_{A+G}(F) \quad (167)$$

$$= d\left(\prod [c^+(G, \cdot)]_A\right)(F) - d\left(\prod [c^+(F, \cdot)]_A\right)(G) \quad (168)$$

$$= 2ic_A^+(G, F) - 2ic_A^+(F, G) \stackrel{(20)}{=} -2ic_A(F, G). \quad (169)$$

This proves the first equality. The second equality follows directly by $d\chi = -2ic$. \square

Definition 11 (corrected lift). *Since $\beta - \chi$ is closed, we may use lem 4 again to define the phase*

$$\alpha := \prod [\beta - \chi]. \quad (170)$$

Furthermore, for all $A, B \in \mathcal{V}$ we define the corrected second quantised scattering operator

$$\tilde{S}_{0,A} := e^{i\alpha_A} \hat{S}_{0,A} \quad (171)$$

$$\tilde{S}_{A,B} := \tilde{S}_{0,A}^{-1} \tilde{S}_{0,B}. \quad (172)$$

Corollary 1 (group structure of the corrected lift). *We have $\tilde{S}_{A,B} \tilde{S}_{B,C} = \tilde{S}_{A,C}$ for all $A, B, C \in \mathcal{V}$.*

Theorem 3 (causality of the corrected lift). *The corrected second quantised scattering operator fulfils the following causality condition for all $A, F, G \in \mathcal{V}$ such that $F < G$:*

$$\tilde{S}_{A,A+F} = \tilde{S}_{A+G,A+G+F}. \quad (173)$$

Proof. Let $A, F, G \in \mathcal{V}$ such that $F < G$. We note that for the first quantised scattering operator we have

$$S_{A+G,A+G+F} = S_{A,A+F}, \quad (174)$$

so by definition of \bar{S} we also have

$$\bar{S}_{A+G,A+G+F} = \bar{S}_{A,A+F}. \quad (175)$$

So for any lift this equality is true up to a phase, meaning that

$$f(A, F, G) := \frac{\tilde{S}_{A+G,A+G+F}}{\tilde{S}_{A,A+F}} \quad (176)$$

is well defined. We see immediately

$$f(A, 0, G) = 1 = f(A, F, 0). \quad (177)$$

Pick $F_1, F_2 < G_1, G_2$. We abbreviate $F = F_1 + F_2, G = G_1 + G_2$ and we calculate

$$f(A, F, G) = \frac{\tilde{S}_{A+G, A+F+G}}{\tilde{S}_{A, A+F}} \quad (178)$$

$$= \frac{\tilde{S}_{A+G, A+F+G}}{\tilde{S}_{A+G_1, A+G_1+F}} \frac{\tilde{S}_{A+G_1, A+G_1+F}}{\tilde{S}_{A, A+F}} \quad (179)$$

$$= \frac{\tilde{S}_{A+G, A+G+F_1}}{\tilde{S}_{A+G_1, A+F_1+G_1}} \frac{\tilde{S}_{A+G+F_1, A+F+G}}{\tilde{S}_{A+G_1+F_1, A+G_1+F}} \frac{\tilde{S}_{A+G_1, A+G_1+F}}{\tilde{S}_{A, A+F}} \quad (180)$$

$$= \frac{\tilde{S}_{A+G, A+G+F_1}}{\tilde{S}_{A+G_1, A+F_1+G_1}} \frac{\tilde{S}_{A+G+F_1, A+F+G}}{\tilde{S}_{A+G_1+F_1, A+G_1+F}} f(A, G_1, F_1 + F_2) \quad (181)$$

$$= f(A + G_1, F_1, G_2) f(A + G_1 + F_1, G_2, F_2) f(A, G_1, F_1 + F_2). \quad (182)$$

Taking the logarithm and differentiating we find:

$$\partial_{F_2} \partial_{G_2} \ln f(A, F_1 + F_2, G_1 + G_2) = \partial_{F_2} \partial_{G_2} \ln f(A + F_1 + G_1, F_2, G_2). \quad (183)$$

Next we pick $F_2 = \alpha_1 F_1$ and $G_2 = \alpha_2 G_1$ for $\alpha_1, \alpha_2 \in \mathbb{R}^+$ small enough so that

$$\|1 - S_{A+F+G, A+F_1+G_1}\| < 1 \quad (184)$$

$$\|1 - S_{A+F+G, A+F_1+G}\| < 1 \quad (185)$$

$$\|1 - S_{A+F+G, A+F+G_1}\| < 1 \quad (186)$$

hold. We abbreviate $A' = A + G_1 + F_1$, use (104) and compute

$$f(A', F_2, G_2) = \frac{e^{i\alpha_{A'+F_2+G_2} + i\theta_{A', A'+F_2+G_2} - i\alpha_{A'+G_2} - i\theta_{A', A'+G_2}}}{e^{i\alpha_{A'+F_2} + i\theta_{A', A'+F_2} - i\alpha_{A'} - i\theta_{A', A'}}} \frac{\bar{S}_{A'+G_2, A'} \bar{S}_{A', A'+F_2+G_2}}{\bar{S}_{A', A'} \bar{S}_{A', A'+F_2}}. \quad (187)$$

The second factor in this product can be simplified significantly:

$$\frac{\bar{S}_{A'+G_2, A'} \bar{S}_{A', A'+F_2+G_2}}{\bar{S}_{A', A'} \bar{S}_{A', A'+F_2}} = \frac{\bar{S}_{A'+G_2, A'} \bar{S}_{A', A'+F_2+G_2}}{\bar{S}_{A', A'+F_2}} \quad (188)$$

$$\stackrel{(33)}{=} \Gamma_{A'+G_2, A', A'+F_2+G_2}^{-1} \frac{\bar{S}_{A'+G_2, A'+F_2+G_2}}{\bar{S}_{A', A'+F_2}} \quad (189)$$

$$\stackrel{(175)}{=} \Gamma_{A', A'+G_2, A'+F_2+G_2} \stackrel{(106)}{=} e^{i\theta_{A', A'+G_2} + i\theta_{A'+G_2, A'+G_2+F_2} + i\theta_{A'+F_2+G_2, A'}}. \quad (190)$$

So in total we find

$$f(A', F_2, G_2) = \frac{e^{i\alpha_{A'+F_2+G_2} + i\theta_{A', A'+F_2+G_2} - i\alpha_{A'+G_2} - i\theta_{A', A'+G_2}}}{e^{i\alpha_{A'+F_2} + i\theta_{A', A'+F_2} - i\alpha_{A'} - i\theta_{A', A'}}} \times \quad (191)$$

$$e^{i\theta_{A', A'+G_2} + i\theta_{A'+G_2, A'+G_2+F_2} + i\theta_{A'+F_2+G_2, A'}} \quad (192)$$

$$= \exp(i\alpha_{A'+F_2+G_2} - i\alpha_{A'+G_2} - i\alpha_{A'+F_2} + i\alpha_{A'} + i\theta_{A'+G_2, A'+G_2+F_2} - i\theta_{A', A'+F_2}). \quad (193)$$

Most of the terms in the exponent do not depend on F_2 and G_2 , so taking the mixed logarithmic derivative things simplify:

$$\partial_{G_2} \partial_{F_2} \ln f(A', F_2, G_2) = i\partial_{G_2} \partial_{F_2} (\alpha_{A'+F_2+G_2} + \theta_{A'+G_2, A'+G_2+F_2}) \quad (194)$$

$$\stackrel{(170), (119)}{=} i\partial_{G_2} (\beta_{A'+G_2}(F_2) - \chi_{A'+G_2}(F_2) + \chi_{A'+G_2}(F_2)) \quad (195)$$

$$\stackrel{(165)}{=} -2c_{A'}^+(F_2, G_2) \stackrel{F_2 < G_2, (22)}{=} 0. \quad (196)$$

So by (183) we also have

$$\partial_{F_2} \partial_{G_2} \ln f(A, F_1 + F_2, G_1 + G_2) = 0 = \partial_{\alpha_1} \partial_{\alpha_2} \ln f(A, F_1(1 + \alpha_1), G_1(1 + \alpha_2)) \quad (197)$$

But then we can integrate and obtain

$$0 = \int_{-1}^0 d\alpha_1 \int_{-1}^0 d\alpha_2 \partial_{\alpha_1} \partial_{\alpha_2} \ln f(A, F_1(1 + \alpha_1), G_1(1 + \alpha_2)) \quad (198)$$

$$= \ln f(A, F_1, G_1) - \ln f(A, 0, G_1) - \ln f(A, F_1, 0) + \ln f(A, 0, 0) \quad (199)$$

$$\stackrel{(177)}{=} \ln f(A, F_1, G_1). \quad (200)$$

remembering equation (176), the definition of f , this ends our proof. \square

Using \tilde{S} we introduce the current associated to it.

Theorem 4 (evaluation of the current of the corrected lift). *For general $A, F \in \mathcal{V}$ we have*

$$j_A(F) = -\beta_A(F). \quad (201)$$

So in particular for $G \in \mathcal{V}$

$$\partial_G j_{A+G}(F) = -2ic_A^+(F, G). \quad (202)$$

holds.

Proof. Pick $A, F \in \mathcal{V}$ as in the theorem. We calculate

$$i\partial_F \ln \langle \Omega, \tilde{S}_{A,A+F} \Omega \rangle \quad (203)$$

$$= i\partial_F \left(i\alpha_{A+F} - i\alpha_A + \ln \langle \Omega, \hat{S}_{0,A}^{-1} \hat{S}_{0,A+F} \Omega \rangle \right) \quad (204)$$

$$= i\partial_F \left(i\alpha_{A+F} + i\theta_{A,A+F} + \ln \langle \Omega, \bar{S}_{A,A+F} \Omega \rangle \right) \quad (205)$$

The last summand vanishes, as can be seen by the following calculation

$$\partial_F \ln \langle \Omega, \bar{S}_{A,A+F} \Omega \rangle = i\partial_F \ln \det_{\mathcal{H}^-} (P^- S_{A,A+F} P^- \text{AG} (P^- S_{A,A+F} P^-)^{-1}) \quad (206)$$

$$= i\partial_F \ln \det_{\mathcal{H}^-} |P^- S_{A,A+F} P^-| = \frac{i}{2} \partial_F \ln \det_{\mathcal{H}^-} ((P^- S_{A,A+F} P^-)^* P^- S_{A,A+F} P^-) \quad (207)$$

$$= \frac{i}{2} \partial_F \det (P^- S_{A+F,A} P^- S_{A,A+F} P^-) = \frac{i}{2} \text{tr} (\partial_F P^- S_{A+F,A} P^- S_{A,A+F} P^-) \quad (208)$$

$$= \frac{i}{2} \text{tr} (\partial_F P^- S_{A,A+F} P^- + \partial_F P^- S_{A+F,A} P^-) = 0 \quad (209)$$

where we made use of (87). So we are left with

$$j_A(F) = -\partial_F (\alpha_{A+F} + \theta_{A,A+F}) = -(\beta_A(F) - \chi_A(F) + \chi_A(F)) = -\beta_A(F). \quad (210)$$

Finally by taking the derivative with respect to $G \in \mathcal{V}$ and using the definition of β we find

$$\partial_G j_{A+G}(F) = -2ic_A^+(F, G). \quad (211)$$

\square
